A Review of the Effects of U.S. Local Sugar-Sweetened Beverage Taxes on Substitution to Untaxed Beverages and Food Items

JULIEN LEIDER1, VANESSA M. ODDO2, LISA M. POWELL1,3

Key Findings

■ Evaluations of U.S. local sugar-sweetened beverage taxes across five taxing jurisdictions have found mixed results on whether these taxes lead to substitution to untaxed beverages.

■ Substitution to food items has only been evaluated empirically in two taxing jurisdictions: Philadelphia, Pennsylvania, and Seattle, Washington. Evaluations in Philadelphia found no evidence of substitution to sweets or salty snacks. Evaluations in Seattle found evidence of substitution to sweets but not salty snacks.

■ One study in Philadelphia and another in Seattle found post-tax decreases in grams of sugar purchased/sold after accounting for potential substitution to other sources of sugar.

Introduction

A majority of U.S. adults and children exceed the Dietary Guidelines for consumption of added sugars,1-3 an excess of which contributes to adverse health outcomes, including obesity, type 2 diabetes, cardiovascular disease, and dental caries.4-7 Sugar-sweetened beverages (SSBs) are the largest source of added sugars intake in the American diet.1,2 As such, reducing SSB consumption is an important public health goal.

SSB taxes are a promising policy tool aimed at reducing consumption and have been implemented in eight local U.S. jurisdictions (Albany, Berkeley, Oakland, and San Francisco, California; Boulder, Colorado; Cook County, Illinois [subsequently repealed]; Philadelphia, Pennsylvania; and Seattle, Washington). These taxes, which range in magnitude from 1 to 2 cents per ounce, typically apply to beverages with added sweeteners and no nutrients (e.g., soda, fruit, energy, and sports drinks) and exclude sweetened/flavored milk; while most have not applied to artificially sweetened beverages (ASBs) with the exception of the Philadelphia and Cook County taxes. Prior studies have shown that SSB taxes in the U.S. (hereafter referring to taxes on SSBs alone and both SSBs and ASBs) reduce the demand for taxed beverages.8 However, these taxes may not only affect the demand for the taxed beverages themselves, but also the demand for substitute beverages and foods.

Substitution to untaxed beverages with no added sugars (e.g., water) is an intended goal of SSB taxes. However, substitution to unhealthful products is a possible unintended consequence. For example, a tax on SSBs may induce substitution to sweets or salty snacks, if an individual is looking to obtain alternative high-sugar or high-calorie foods. Thus, it is important to understand the extent to which taxes may result in substitution toward untaxed food and beverage products that could undermine the intended public health goals of these taxes. This research brief summarizes findings from peer-reviewed studies and governmental reports that evaluate substitution to untaxed beverages and food items in response to local U.S. SSB taxes.

One row is shown per study, unless the study relied on multiple distinct data sources/ measures or reported separate estimates for adults and children. Cells with “--” indicate the given item was not assessed. Cells with “N/A” are not applicable because the given item was taxed in the study jurisdiction.

1 Decrease in probability of consuming 100% juice; no change in primary consumption measure.
2 Increase in volume sold of diet soft/energy drinks.
3 Increase in volume sold of plain milk, but decrease in volume sold of milk-based or milk substitute drinks.
4 Increase in volume sold of fruit/vegetable/tea drinks (treated as a group).
5 Increase in calories consumed reported to be primarily from milk and other beverages; detailed results by beverage type not reported.
6 No change for diet soda; no other diet drinks examined.

Substitution to Untaxed Beverages

- As shown in Table 1, a number of studies did not assess substitution to untaxed beverages broadly and others that provided broad measures did not assess beverage types. For example, four studies only assessed substitution to water, and one study only assessed substitution to diet drinks. Seven studies only assessed substitution to untaxed beverages overall and did not assess changes by untaxed beverage type.

- Evaluations of U.S. local SSB taxes have found mixed results on whether these taxes lead to substitution to untaxed beverages both across and within taxing jurisdictions.

- No U.S. local SSB tax has applied to 100%/unsweetened juice, although there have been recommendations that it be taxed as a source of free sugars.31 Of studies that evaluated substitution to juice, while some have found substitution,10,19,25 the majority have not.14,16,17,26,28

- No U.S. local SSB tax has applied to calorically flavored/sweetened milk. Only two studies have specifically examined substitution to this, both in Seattle, with one finding no change in volume sold of sweetened milk at two-years post-tax,28 and the other finding an increase in sugar sold from sweetened milk at one-year but not two-years post-tax.29 Of studies that have examined substitution to milk more broadly, there have been mixed results with some studies finding evidence of substitution10,16,17 and others not.14,19,26

- Research on substitution to beverage concentrates is limited (and not reported in the table above). One study found increases in volume sales in grams of beverage concentrates (which were untaxed) in supermarkets but not other store types,32 while another study in the same jurisdiction found no change in unit sales of beverage concentrates.20

Substitution to Food Items

- Substitution to food items in response to U.S. local SSB taxes has only been evaluated empirically in Philadelphia and Seattle.

- In Philadelphia, no substitution was found to sweets or salty snacks, and an overall reduction in calories and sugar purchased from sweetened beverages and high-sugar foods was found up to two-years post-tax.

- In Seattle, there was evidence of substitution to sweets but not salty snacks. A net reduction was found in sugar sold from taxed SSBs after accounting for substitution to sweets as well as standalone sugar and untaxed beverages.

- Different findings in Philadelphia and Seattle may be explained by differences in sociodemographic and socioeconomic characteristics, tax base (the Philadelphia tax applied to both SSBs and ASBs while the Seattle tax only applied to SSBs), and other tax avoidance behaviors such as cross-border shopping (evaluations have found cross-border shopping in response to the Philadelphia tax20,25 but no evidence of cross-border shopping has been found in response to the Seattle tax26,28).
Conclusions

Evaluations of local U.S. SSB taxes have found mixed results on whether taxes lead to substitution to untaxed beverages or food items. Results show limited evidence of substitution to untaxed beverages that are likely to be important sources of added or free sugars. While there is some evidence of substitution to sweets, results still show reductions in sugar purchased or sold from taxed beverages after accounting for this. These findings support the ability of SSB taxes to lead to reductions in added sugars consumption and associated chronic diseases.
